Project Name	Automated Incident Management Lifecycle using ServiceNow
Maximum Marks	2 Marks

Problem – Solution Fit: The proposed ServiceNow solution addresses the IT incident management problem by providing a standardized incident lifecycle with classification, knowledge assistance, escalation, change integration, child-incident tracking, resolution, knowledge creation, and SLA visibility.

Problem – Solution Fit

The problem is addressed by replacing fragmented incident handling with a standardized ServiceNow Incident workflow. The solution captures complete incident information, supports classification and Agent Assist knowledge, routes work to Level 2 teams, integrates emergency changes and child incidents, records cause and resolution, creates reusable knowledge, and provides SLA and related-record visibility.
