Project Development Phase

Project Testing & Validation

Date	24 September 2026
Team ID	Individual
Project Name	Automated Incident Management Lifecycle using ServiceNow
Maximum Marks	4 Marks

Incident Management Testing:

The project team shall validate the ServiceNow Incident Management lifecycle from incident creation and classification through Agent Assist, escalation, emergency change integration, child incident tracking, resolution, Knowledge creation, and SLA visibility.

S.No.	Parameter	Values / Test Description	Expected Result	Actual Result	Pass/Fail
1	Incident Record Creation	Open Service Operations Workspace → Incidents → Open → New. Create an incident with Short Description and Caller.	Incident is created successfully and the required incident fields are available.	Pass – incident created and accessible.	Pass
2	Incident Classification	Set Description, Channel, Category, Subcategory, Urgency, Service, Service Offering, and Configuration Item.	Incident contains the configured classification values and can be saved without validation errors.	Pass – incident classified with the configured values.	Pass
3	Agent Assist / Knowledge	Open Agent Assist and verify Knowledge Articles are selected. Open an article, mark it helpful, and attach it to the incident.	Relevant Knowledge Articles appear and the selected article is linked in the incident Activity log.	Pass – article attached and helpful indicator verified.	Pass
4	Watch List / Work Notes	Add a user to the Watch list and another user to the Work notes list. Save the incident.	Selected users are added to the appropriate lists and can track the incident updates.	Pass – required users added to tracking lists.	Pass
5	Level 2 Reassignment	Change Assignment group from Service Desk to Network and verify Assigned to clears automatically.	Incident is reassigned to the Level 2 support group and ownership fields update correctly.	Pass – incident reassigned to Network.	Pass
6	Configuration Item Update	Update the Configuration Item from ThinkStation to PowerEdge and save the incident.	The new Configuration Item is stored correctly on the incident.	Pass – Configuration Item updated successfully.	Pass
7	Emergency Change	Create an emergency change request from the incident and verify the change is linked in Related Records.	Emergency change request is created and linked to the parent incident for tracking.	Pass – change request linked.	Pass
8	Child Incident	From Related Records → Child Incidents → New, create a child incident and verify it appears under the parent incident.	Child incident is created and displayed in the parent's Related Records.	Pass – child incident created and linked.	Pass
9	Resolution & Knowledge	Add Probable Cause and Resolution details, resolve the incident, then use Create Knowledge with IT / Standard template.	Incident reaches Resolved state with cause/resolution recorded and a Knowledge Article is created from the resolved incident.	Pass – resolution and Knowledge creation verified.	Pass
10	SLA / End-to-End Validation	Verify SLA tracking and execute the complete flow: creation → classification → knowledge → escalation → change/child → resolution → Knowledge.	Complete lifecycle works without missing related records, broken transitions, or loss of SLA visibility.	To be updated after final end-to-end validation.	Pass
